

# Module 5

## AquaCropPlotter

# Riccardo Soldan

May 30, 2023

- This presentation will focus on how to visualize and interpret AquaCrop results when running multiple simulations.
- AquaCrop results are txt files with extension OUT. Even with fairly simple experimental designs, such as multiple locations and multiple years of simulations, you can easily find yourself with more than 10 files. This can scale up to hundreds of files.
- We developed AquaCropPlotter, an app that can automatically load and process the results of AquaCrop.

- AquaCropPlotter can be found on [GitHub](#).
- AquaCropPlotter can be run locally after installing the app in R or it can be used online.
- In this tutorial we will use the online version.

➤ The app works in four steps:

1. Load the data
2. Combine the data
3. Plot the data
4. Analyse the data

# Important: Input requirements

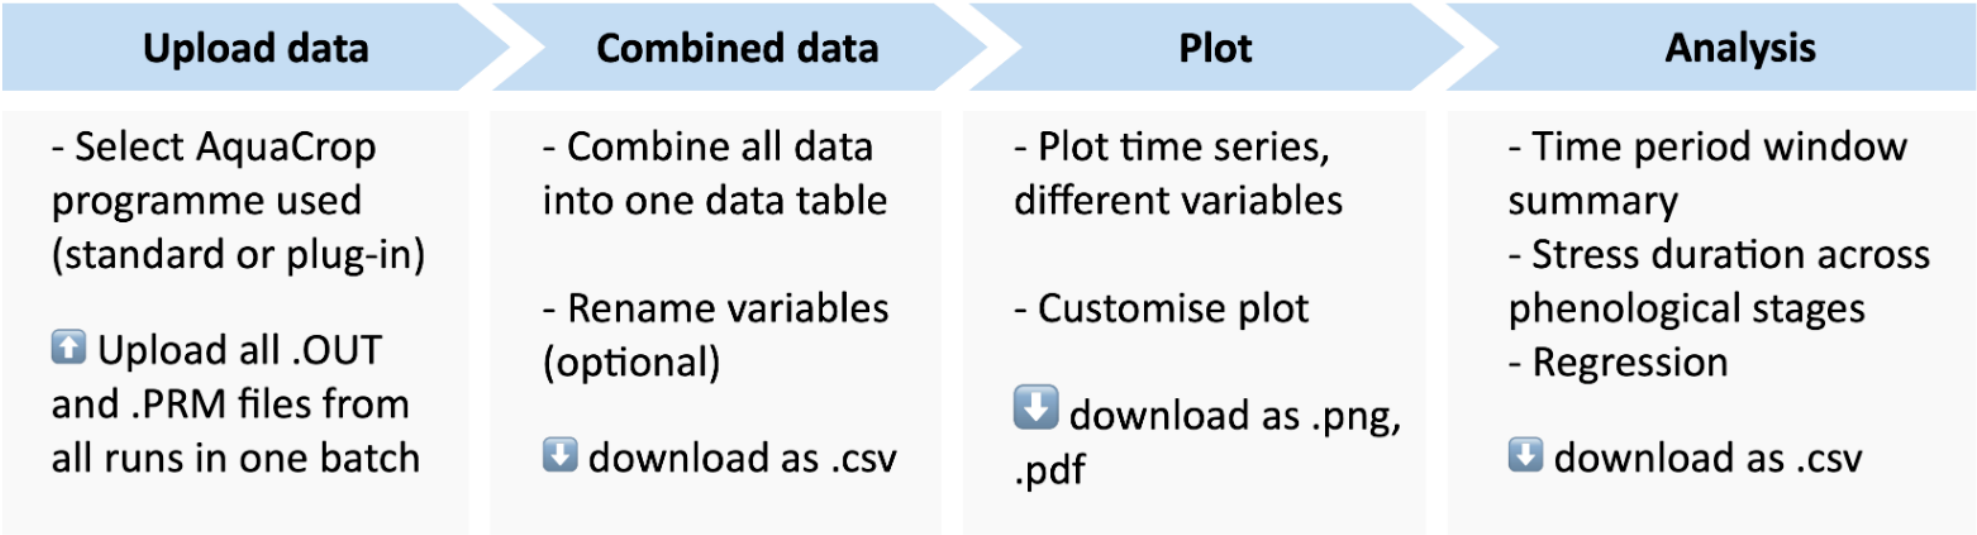

- When you run AquaCrop, you will have PRM and OUT files. Place them in the same folder before uploading the data in AquaCropPlotter.
- **Correctly specify the file name (variables separated by underscore)**

Location\_crop\_sowingDate

Rename parameter column

Select column to rename

name.variable3

Rename to

Station

Rename

Here you can select how to rename a column. For example, in this case, name.variable3 was assigned to the different stations

filter dataset

Select column to filter by

name.variable3

Select values to keep

Centre

North

South

Here you can decide whether you want to only keep certain level of a variable

Add labels to historical data by year

Select column to add label to

Select year range to label

0

0

Label as

historical

Label

Reset

# Plot the data

Select plotting variables

Data type to plot

seasonal

Variable to plot on Y axis

Y(dry)

Variable to plot on X axis

Year1

> Next

Select grouping variables

Variable to split into colors by

i

Station

Variable to split into point shapes by

i

Variable to split into line types by

i

Variable to split into subpanels by

i

> Next

Select plot elements

Components of plot to show

i

point line

Plot mean values

i

No

> Plot

For even more customization

Customise & export plot

# Load the data and next steps

- In this tutorial we will be working with AquaCrop simulations for maize grown in 2 locations and 2 RCPs
- The data to be uploaded to the app is found [here](#)
- The rest of the tutorial will be about using the app directly
- For additional documentation, [visit our page](#)

# Thank you!
